Stock Cropper Inc. (www.thestockcropper.com) is poised to take advantage of the growing demand for regenerative agriculture practices. The company's innovative "ClusterCluck Barn" system merges traditional and modern farming techniques to create a diversity of plants and animals, all raised on the soil. The barns are autonomous, solar-powered, and can be monitored and controlled through a mobile app. The ClusterCluck Barn system is scalable, from backyard poultry to small and large scale regenerative production. With four prototype barns produced since 2020, a manufacturing and engineering partnership with Dawn Equipment, and a recent win at the University of Iowa Venture School Entrefest, Stock Cropper has established a strong foundation for growth.

Investment in 2023 will be used to further develop the ClusterCluck Barns and demonstrate the benefits of the system through field research plots and customer placements. The market potential for Stock Cropper is substantial, with estimated revenue of $20 billion from backyard poultry, $1.3 billion from small scale US farm operations, $10 billion from vineyards, and $135 billion from large scale regenerative production.
